AutoCAD Free [32|64bit]

Today, AutoCAD is most widely used for architectural, mechanical, civil, and electrical engineering purposes, by engineers, architects, and drafters in the construction industry, and in industry. AutoCAD is the most popular CAD software application, with some 85% of the world's 2.6 million CAD users preferring it. AutoCAD is the most common application for 3D modeling and visualization in the fields of architecture, design, construction, manufacturing, and media. AutoCAD's sophisticated scripting language allows users to customize the program to meet their individual needs. AutoCAD has also been used by government and military departments for a wide variety of purposes, such as the design of warships, bridges, machinery, railroad cars, and aircraft. AutoCAD basics The foundation of AutoCAD is the dynamic block editor, which lets users draw the 3D objects of any shape, size, and complexity and connect them into a single 3D model. With AutoCAD, they are able to work with any object they want, simply by drawing them. The dynamic block editor is capable of recording and recording to file simultaneously. Users can also use named 3D blocks to create custom shapes that can be dragged and dropped into other documents. In AutoCAD, users may also freely move objects (such as blocks) in a drawing by rotating or translating them. Users can also copy, duplicate, and move a drawing. The display of AutoCAD consists of two main views. One is the overview, which presents the view of the entire 3D model, including the block, object, and other information that it contains. The other is the design, which displays the view of a particular object. The design view can be displayed in either orthographic or perspective. The drawing history is the source for the AutoCAD drawing. The RVC or Raster Viewer is the viewing area of the AutoCAD window, which is actually the entire CAD document. Its purpose is to display raster (bitmap) information, such as a pixel (dot) map that a scanner produces, as well as data from a laser level. The RVC provides the graphical interface for the input of scale, position, and rotation. The RVC is used for modeling, dimensional management, and visualizing the 3D model. Also, the RADAR tool in AutoCAD allows you to visualize and measure distances on the drawing screen. This type of view is called the

AutoCAD Crack+ For PC [2022-Latest]

The basic principle of the API is that the user of a program calls functions to get information about the drawing or to modify the drawing and then saves the drawing. Example: call the named object The following example shows how one can get a drawing's name: getObject(objName); or the current view: getCurrentView(viewName); or the current layer: getCurrentLayer(layerName); or the current block, view and layer: getCurrentBlock(blockName); get the current entity, the current block, the current view, or the current layer: getCurrentEntity(entityName); or get a new entity: createEntity(name, z, x, y); get the current block view, or a new view: getCurrentView(viewName); or the current document: getCurrentDocument(); or the current drawing document: getCurrentDocument(documentName); call a named object, modify it and save it: doObject(); read an object or path: readObject(pStr, obj); read a drawing: readDrawing(name); read a layer: readLayer(layerName); save: save(); write: write(); .NET API A.NET add-on application is made with Visual Studio using C# or VB.NET. The idea is that the functions are just called like in the AutoCAD API. The API consists of two parts: The part, which calls the.NET API function with the parameters of the function. The other part, which gets the return value of the function and formats it. Example: call the named object The following example shows how one can get a drawing's name: getObject(objName); or the current view: getCurrentView(viewName); or the current layer: getCurrentLayer(layerName); or the current block, view and layer: getCurrentBlock(blockName); get the current entity, the current block, the current view, or the current layer: getCurrentEntity(entityName); call a named object, modify it and save it: doObject(); read an object or path: readObject(pStr, a1d647c40b
