Futebol Campo de dias de onda mais do que oportunidade.The present invention relates to data processing and more particularly to error recovery in a data processing system. An error may occur in a data processing system which may negatively impact operation of the system. A data processing system typically includes a storage device which stores data. For example, a data processing system may include a storage device in which data is stored. The storage device may be provided by a host system or by an expander associated with the host system. A storage device may include magnetic disk drives and semiconductor memory devices. The host system can perform read and write operations to the storage device. For example, the host system may include a server which serves files via a network to one or more client systems or end user systems. The client systems may include a desktop computer or workstation. The client systems may also include a portable computing device such as a laptop computer. The host system can include a storage device which is directly connected to the host system. Alternatively, the storage device may be implemented in the form of a disk array. A disk array is a redundant array of independent disks. The disk array is also referred to as a “Redundant Array of Independent Disks” (RAID) disk array. A storage device in a RAID disk array may be referred to as a RAID device. A RAID device typically includes a disk array that includes a plurality of “n” disk drives and one or more disk controllers. The RAID device may include a disk array controller which controls access to the disk drives in the RAID disk array. The controller includes one or more error correction algorithms that may be used to correct data errors that may occur in the storage device. For example, the error correction algorithms may correct unassigned data errors or data errors that are unassigned. An uncorrectable data error may occur in a host system. For example, an error may occur in a processor in the host system. The host system may include a RAID device that stores data in a RAID array. The processor of the host system may perform read and write operations to the RAID array. For example, the host system
